Summary

Capstone Design Project Overview

The project is described as the "finale" of the curriculum, requiring you to integrate everything you've learned into a single, comprehensive design.

1. Project Parameters

- **Self-Defined:** You are responsible for creating your own project concept.
- **Scope:** The course will provide "parameters" (参数 - cānshù) or limits to ensure your project is realistic and reasonable.

2. The Design Process (Grading Focus)

Your grade isn't just about the final product; it's primarily about how well you document the **Design Process** (设计过程 - shèjì guòchéng). You will submit peer assessments across three specific stages:

1. **Requirement Specification:** Defining exactly what the system needs to do at the start.
2. **System Design:** The architectural phase where you plan how it works.
3. **Testing:** The final phase to verify the system's performance.

3. Final Deliverables

- **Documentation:** Reports for each stage of the design.
- **Optional Implementation:** If you choose to manufacture/build the project, you must submit a **video** of the working system to be graded on its performance.
